

## Overview of the project

Frank Lepcha

In my IPUMS project, I focused on analyzing labor force participation trends among elderly immigrants in the US. Using data from IPUMS, I examined how demographic factors such as gender, race/ethnicity, and education level impacted employment status within this population. By cleaning and structuring the data, I identified patterns in workforce participation, comparing demographic subgroups and highlighting trends. I also explored workforce trends among immigrants aged 30 to 50, providing a broader perspective on labor force engagement across age groups. This project involved extensive data preprocessing, parameter selection, and visualization to uncover meaningful insights into employment patterns among diverse immigrant populations.
